

the **neighborhood** project

Quick-start Guide to Streaming Your Neighborhood Project Episodes:

COMPUTER to TV via WiFi

1 **Get your episode cued up on your Computer.**

Login at theneighborhoodproject.com, go to member content and click “watch episodes” to play this month’s episode.

2 **Identify your receiving device.**

To connect your Computer via wifi usually requires a receiving device such as a Smart TV, Apple TV, Google Chromecast, Roku, or Amazon FireTV. In general, the computer you use will determine which receiving device you can use:

From Macs to Apple TV

From Macs, PCs or Chromebooks to Google Chromecast, Roku or Amazon Fire TV receivers

3 **Connect your Computer to your TV via Wifi.**

To mirror your computer's screen to your TV screen, be sure you are on the same Wifi network as your receiving device, then select the icon on your computer's menu bar like one of the icons above. Click that icon and select your receiving device by name to mirror your computer's screen to your TV.

If you are having trouble connecting, consult your receiving device's instruction manual to learn how to mirror your computer's screen to your TV screen.

4 **Test your episode before your guests arrive.**

This is really important to do when streaming via wifi. Play the episode through to make sure it's streaming properly. Trouble shooting suggestion: keep other folks off the network when streaming (don't want anyone else eating up that bandwidth).
